

COATING COMPOSITION YIELDING ABRASION-RESISTANT TINTABLE COATINGS

Field of the Invention

This invention relates to the field of transparent coatings for transparent objects such as eyeglass lenses, and refers particularly to a coating compositions having low viscosities and 5 coating compositions producing abrasion-resistant coatings exhibiting high tintability.

Background of the Invention

Transparent plastic materials such as eyeglass lenses are subject to becoming dull and hazy due to scratching and abrasion during use. Polycarbonate eyeglass lenses, for example, are strong and shatter resistant but also are relatively soft and susceptible to scratching.

Television screen face plates similarly are made of flexible, shatter resistant plastic materials such as polycarbonate and poly (methylmethacrylate), and these also can be scratched or abraded.

Various coatings have been proposed for eyeglasses and other transparent plastic materials to reduce their propensity to become scratched and abraded. One such composition is shown in U.S. Patent 4,378,250 (Treadway, *et al.*) granted March 29, 1983. Other coatings are shown in U.S. Patents 5,367,019 (Sawara), 4,855,180 (Kawamura), 4,895,767 (Mori *et al.*) and 4,719,146 (Hohage *et al.*) Besides being abrasion resistant, coatings for eyeglass lenses should also be capable of being tinted by treatment with a dye which becomes incorporated in the coating. As a general observation, the tintability of a coating tends to decrease as its hardness 20 and scratch resistance increases, and vice-versa.

Harasta, *et al.* U.S. Patent 4,426,431 discusses a coating composition referred to as a "hybrid" system because it employs a solution, in a solvent such as propylene carbonate, of an epoxy compound and a cationic initiator for it, and an acrylic compound and a free radical

initiator for it. In general, coating compositions suitable for use in forming protective transparent coatings on eyeglass lenses and the like are provided in solution in a volatile solvent, the solvent serving as a low viscosity vehicle to enable the coating composition to be uniformly spread upon a surface and to accept dye treatments. The solvents that are employed are for the most part organic, and must be used and disposed of carefully.

5 Perkins *et al.* U.S. Patent 5,221,560 describes a coating composition containing a

polyfunctional, polymerizable non-acrylate functional ether, a radiation-sensitive initiator, and colloidal silica in an amount providing at least 25% by weight of the total solids of the composition, the silica being reacted with a small amount of a hydrolyzed acryloxy-functional or glycidoxo-functional silane.

10 Treadway, PCT Publication WO 98/39390 describes a coating composition that is substantially free of volatiles and that employs a hydrolysis product of an epoxy-functional silane and also a polymerizable ether. The latter is said to impart tintability to cured coatings of the composition.

15 U.S. patent 5,866,262 (Gallic *et al.*) teaches the use of fully hydrolyzed epoxy-functional and imine-functional alkoxysilanes in coating compositions for eyeglass lenses, whereas the previously mentioned U.S. Patent 4,378,250 (Treadway, *et al.*) teaches that such hydrolysis of

20 epoxy-and imine-functional alkoxysilanes may be less than stoichiometric.

Coating compositions of the type used to provide coatings on such substrates as polycarbonate eye glass lenses desirably are of low viscosity. Moreover, as noted earlier, they desirably are capable, upon curing, of forming surfaces that on the one hand are hard and scratch-resistant and on the other hand are tintable, that is, are capable of readily accepting tinting dyes.

Summary of the Invention

The present invention provides coating compositions yielding cured coatings that exhibit excellent abrasion-resistance and that readily accept tinting dyes. The compositions preferably are of low viscosity and most preferably are substantially free of volatile solvents.

5 In one embodiment, a composition of the invention comprises the hydrolysis product of an epoxy-functional alkoxy silane, a curing agent therefor, an ethylenically unsaturated monomer and also an unhydrolyzed epoxy-functional alkoxy silane. The ethylenically unsaturated monomer component desirably comprises an acrylic monomer, preferably an acrylic monomer having an acrylic functionality of not more than two.

10 I have found that inclusion of an unhydrolyzed epoxy-functional alkoxy silane in the coating composition enables a substantial reduction in the viscosity of the composition to be achieved, without loss of abrasion resistance. Amounts of the unhydrolyzed silane sufficient to significantly reduce viscosity of the coating composition up to about 50 % by weight, solids basis, are used.

15 It has also been found that the tintability of coatings derived from a composition comprising the hydrolysis product of an epoxy-functional alkoxy silane, a curing agent therefor and an ethylenically unsaturated monomer, can be substantially improved by incorporating in the composition a non-reactive polyether surfactant.

20 Hence, the invention in another embodiment relates to a coating composition comprising the hydrolysis product of an epoxy-functional alkoxy silane, a curing agent therefor, an ethylenically unsaturated monomer, and a non-reactive polyether surfactant in sufficient quantity to improve tintability of a cured coating made from the composition. Tintability is so improved by the addition of the polyether surfactant that the coating composition preferably is free of vinyl

ethers and reactive non-silane epoxy ingredients. However, as required, the incorporation in the 1,1-ethers may further improve tintability.

coating composition of non-silane glycidyl ethers may further improve tintability. preferably include a cationic ini

The coating compositions of the invention preferably include a cationic initiator such as a diaryl iodonium hexafluoroantimonate and a free radical initiator to initiate polymerization of the ethylenically unsaturated coating components. The composition may include one or more additional epoxy-functional compounds, acrylic monomers, and other ingredients, including 5 colloids, although preferably the composition is free of silica and most preferably is substantially free of colloids.

Description of the Preferred Embodiments.

Description of the Preferred Embodiments.

In coating compositions of the invention, the epoxy functional alkoxy silane precursor of the at least partially hydrolyzed polymerizable ingredient is preferably an epoxyalkylalkoxysilane of the following structure:

trimethoxysilane, γ -glycidoxypropyl-triethoxysilane, γ -glycidoxypropyl-tripropoxysilane, γ -trimethoxysilane, γ -glycidoxypropyl-tributoxysilane, β -glycidoxypropyl-trimethoxysilane, β -glycidoxypropyl-glycidoxypropyltributoxysilane, β -glycidoxypropyl-tripropoxysilane, β -glycidoxypropyltributoxysilane, α -triethoxysilane, β -glycidoxypropyl-tripropoxysilane, α -glycidoxypropyl-triethoxysilane, α -glycidoxypropyl-glycidoxypropyl-trimethoxysilane, α -glycidoxypropyl-tributoxysilane, γ -glycidoxypropyltributoxysilane, α -glycidoxypropyl-tripropoxysilane, α -glycidoxypropyl-tributoxysilane, γ -glycidoxypropyl-trimethoxysilane, δ -glycidoxypropyltributoxysilane, δ -glycidoxypropyl-tripropoxysilane, δ -glycidoxypropyl-tributoxysilane, δ -glycidoxypropyl-trimethoxysilane, γ -glycidoxypropyl-tributoxysilane, γ -glycidoxypropyl-tripropoxysilane, α -glycidoxypropyl-trimethoxysilane, δ -glycidoxypropyl-tributoxysilane, α -glycidoxypropyl-tripropoxysilane, α -glycidoxypropyl-tributoxysilane, γ -glycidoxypropyl-trimethoxysilane, α -glycidoxypropyl-tributoxysilane, δ -glycidoxypropyl-tributoxysilane, α -glycidoxypropyl-trimethoxysilane, γ -glycidoxypropyl-tributoxysilane, (3,4-epoxycyclohexyl)-methyl-tripropoxysilane, α -glycidoxypropyl-tributoxysilane, (3,4-epoxycyclohexyl)methyl-trimethoxysilane, (3,4-epoxycyclohexyl)methyl-tributoxysilane, (3,4-epoxycyclohexyl)ethyl-tripropoxysilane, (3,4-epoxycyclohexyl)-methyl-tributoxysilane, (3,4-epoxycyclohexyl)ethyl-trimethoxysilane, (3,4-epoxycyclohexyl)ethyl-tributoxysilane, (3,4-epoxycyclohexyl)ethyl-tripropoxysilane, (3,4-epoxycyclohexyl)-ethyl-tributoxysilane, (3,4-epoxycyclohexyl)propyl-tripropoxysilane, (3,4-epoxycyclohexyl)propyl-tributoxysilane, (3,4-epoxycyclohexyl)propyl-trimethoxysilane, (3,4-epoxycyclohexyl)propyl-tributoxysilane, (3,4-epoxycyclohexyl)butyl-tripropoxysilane, (3,4-epoxycyclohexyl)butyl-tributoxysilane, (3,4-epoxycyclohexyl)butyl-trimethoxysilane, (3,4-epoxycyclohexyl)butyl-tributoxysilane, (3,4-epoxycyclohexyl)butyl-tripropoxysilane, and (3,4-epoxycyclohexyl)butyl-tributoxysilane.

20 A particularly preferred epoxyalkylalkoxysilane is γ -glicidoxypropyl trimethoxy silane due to its wide commercial availability.

due to its wide commercial availability.

Hydrolysis of the epoxy-functional alkoxysilane precursor may occur in an acidic environment, and reference is made to U.S. patent 4,378,250, the teachings of which are

incorporated herein by reference. Hydrolysis of the alkoxy groups liberates the associated alcohol (which may be stripped off) to form silanol groups; these, in turn, are relatively unstable and tend to condense spontaneously. Hydrolysis of the alkoxy silane may but need not be complete, and preferably, the alkoxy silane is reacted with a stoichiometrically sufficient quantity of water to hydrolyze at least 50% of the alkoxy groups and most preferably from about 60% to about 70% of the alkoxy groups. For the hydrolysis of an epoxy-functional trialkoxy silane, good results have been obtained by reacting the silane with a stoichiometrically sufficient quantity of water to hydrolyze two-thirds of the alkoxy groups.

5 The at least partially hydrolyzed epoxy-functional silane is present in the coating compositions of the invention at a weight concentration (solids basis) of about 10% to about 10 75%, and preferably about 20% to about 50%.

10 In addition to the partially or fully hydrolyzed epoxy-functional alkoxy silane, as noted above, the composition desirably includes an effective amount up to about 50% by weight, solids basis, of a non-hydrolyzed, and suitable epoxy-functional alkoxy silanes include the silanes listed above. The non-hydrolyzed epoxy-functional alkoxy silane desirably is present in an amount not less than about 10%, preferably at least about 20%, and most preferably from about 15 40% to about 50% by weight, solids basis. Preferably, the epoxy-functional alkoxy silane that is included as the non-hydrolyzed component also is employed to make the hydrolyzed component. It should be understood that the hydrolyzed and non-hydrolyzed components may be different 20 and each may utilize one or a blend of different epoxy-functional alkoxy silanes, as desired.

Useful cationic initiators for the purposes of this invention include the aromatic onium salts, including salts of Group Va elements, such as phosphonium salts, e.g., triphenyl phenacylphosphonium hexafluorophosphate, salts of Group VIa elements, such as sulfonium

10 salts, e.g., triphenylsulfonium tetrafluoroborate, triphenylsulfonium hexafluorophosphate and salts, such as diphenyliodonium chloride and diaryl iodonium hexafluoroantimonate, the latter being preferred. The aromatic onium salts and their use as cationic initiators in the 5 polymerization of epoxy compounds are described in detail in U.S. Pat. No. 4,058,401, "Photocurable Compositions Containing Group VIA Aromatic Onium Salts," by J. V. Crivello issued Nov. 15, 1977; U.S. Pat. No. 4,069,055, "Photocurable Epoxy Compositions Containing Group VA Onium Salts," by J. V. Crivello issued Jan. 17, 1978, U.S. Pat. No. 4,101,513, "Catalyst For Condensation Of Hydrolyzable Silanes And Storage Stable Compositions Thereof," by F. J. Fox et al. issued July 18, 1978; and U.S. Pat. No. 4,161,478, "Photoinitiators," by J. V. Crivello issued July 17, 1979, the disclosures of which are incorporated herein by reference.

15 Other cationic initiators can also be used in addition to those referred to above; for example, the phenyldiazonium hexafluorophosphates containing alkoxy or benzyloxy radicals as substituents on the phenyl radical as described in U.S. Pat. No. 4,000,115, "Photopolymerization Of Epoxides," by Sanford S. Jacobs issued Dec. 28, 1976, the disclosure of which is incorporated herein by reference. Preferred cationic initiators for use in the compositions of this invention are the salts of Group VIA elements and especially the sulfonium salts, and also the Group VIIa elements, particularly the diaryl iodonium hexafluorantimonates. Particular cationic catalysts 20 include diphenyl iodonium salts of tetrafluoro borate, hexafluoro phosphate, hexafluoro arsenate, and hexafluoro antimonate; and triphenyl sulfonium salts of tetrafluoroborate, hexafluoro phosphate, hexafluoro arsenate, and hexafluoro antimonate.

A wide variety of ethylenically unsaturated monomers (including oligomers) can be employed in the coating composition of the invention, and acrylic monomers and oligomers, particularly those having acrylic functionalities of not greater than two, are preferred. Useful acrylic compounds for improving adhesion to polycarbonate substrates include both mono and di-functional monomers, but other or additional polyfunctional acrylic monomers may also be included.

5 Examples of monofunctional acrylic monomers include acrylic and methacrylic esters such as ethyl acrylate, butyl acrylate, 2-hydroxypropyl acrylate, cyclohexyl acrylate, 2-ethylhexyl acrylate, methyl methacrylate, ethyl methacrylate, and the like. Examples of 10 polyfunctional acrylic monomers, including both difunctional and tri and tetrafunctional monomers, include neopentylglycol diacrylate, pentaerythritol triacrylate, 1,6-hexanediol diacrylate, trimethylolpropane triacrylate, tetraethylene glycol diacrylate, 1,3-butylene glycol diacrylate, trimethylolpropane trimethacrylate, 1,3-butylene glycol dimethacrylate, ethylene diacrylate, trimethylolpropane triacrylate, pentaerythritol tetraacrylate, tetraethylene glycol dimethacrylate, 1,6-glycol dimethacrylate, 1,6-pentaerythritol diacrylate, diethylene glycol diacrylate, glycerol hexanediol dimethacrylate, ethylene glycol diacrylate, diethylene glycol diacrylate, glycerol diacrylate, glycerol triacrylate, 1,3-propanediol diacrylate, 1,3-propanediol dimethacrylate, 1,2,4-diacrylate, 1,5-pentanediol dimethacrylate, 1,4-cyclohexanediol diacrylate, 1,4-cyclohexanediol dimethacrylate, 20 butanetriol trimethacrylate, 1,4-cyclohexanediol diacrylate, 1,4-cyclohexanediol dimethacrylate, pentaerythritol diacrylate, 1,5-pentanediol dimethacrylate, and the like. The acrylic-functional monomers and oligomers desirably are employed at a weight concentration of at least about 10% by weight, preferably from about 10% to about 50%, and most preferably from about 10% to about 25%, all on a solids basis.

As initiators for the ethylenically unsaturated monomers, photoactivated free-radical initiator are preferred, although thermally activated free radical initiators may also be used.

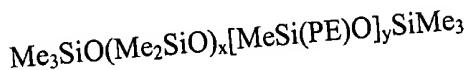

Useful photoinitiators for this purpose are the haloalkylated aromatic ketones, chloromethylbenzophenones, certain benzoin ethers, certain acetophenone derivatives such as diethoxyacetophenone and 2-hydroxy-2-methyl-1-phenylpropan-1-one. A preferred class of free-radical photoinitiators is the benzil ketals, which produce rapid cures. A preferred 5 photoinitiator is α,α -dimethoxy- α -phenyl acetophenone (IragacureTM 651, Ciba-Geigy, disclosed in U.S. Pat. Nos. 3,715,293 and 3,801,329). The most preferred photoinitiator, in accordance with this invention, is 2-hydroxy-2-methyl-1-phenylpropane-1-one (DarocureTM 1173, Ciba-Geigy Corporation). Specific examples of photoinitiators include ethyl benzoin ether, isopropyl benzoin ether, dimethoxyphenyl acetophenone, diethoxy acetophenone, and benzophenone.

In a preferred embodiment, the coating composition is substantially free of volatile solvents and also preferably is free of silica and free of other colloids.

The surfactants useful in the present invention to promote tintability are non-reactive polyethers, and may be water soluble, water dispersible or water insoluble. As used here, "non-reactive" means that the polyether does not significantly participate in the curing reaction involving the epoxy-functional alkoxy silane or the ethylenically unsaturated monomers. A variety of non-reactive polyethers can be employed, including the various poly (alkylene glycol) and poly (alkylene oxide) surfactants, and are chosen for their ability to significantly improve tintability. Preferred polyethers include polyalkylene oxide modified polymers such as 20 polyalkylene oxide modified siloxanes (including polyalkylene oxide modified dimethylsiloxanes and polyalkylene oxide modified heptamethylsiloxanes), the alkoxy polyalkylene oxyethanols, and the substituted polyglycols such as nonylphenol polyethylene glycol. The polyalkylene oxide modified siloxanes may be in liquid or solid form.

Polyalkylene oxide modified polydimethylsiloxanes, as an example, may have the

formula:

where Me is methyl and PE is $-(\text{CH}_2)_3\text{O}(\text{EO})_m(\text{PO})_n\text{Z}$. Here, These surfactants are referred to

5 as "AP" (alkyl-pendant) types. Other polyalkylene oxide modified siloxanes may have the

general formula $(\text{MeSi})_{y-2}[(\text{OSiMe}_2)_{x/y}\text{O-PE}]_y$, where PE is $-(\text{EO})_m(\text{PO})_n\text{R}$, R being lower alkyl.

The latter surfactants are referred to as the "AEB" (alkoxy endblocked) type. In these general formulas, EO represents ethyleneoxy, PO represents 1,2-propyleneoxy, Z is H or lower alkyl,

and x, y, m and n can vary as desired.

A series of polyalkylene oxide modified siloxane surfactants as thus described are

available from Witco Corporation under its registered trademark SILWET. Alkoxyalkylene oxyethanols, and the substituted polyglycols such as nonylphenol polyethylene glycol, are

generally available from Union Carbide Corporation under its registered trademark TERGITOL.

The amount of surfactant to be used in a coating composition is the amount which provides the desired tintability to cured coatings derived from the composition, and this amount may range from a minimum amount – usually a percent or two by weight – that provides noticeable improvement in tintability up to about 10% by weight or more. Amounts of surfactant in the range of about 1% to about 10% by weight of the composition are usually appropriate, and surfactant concentrations of about 4% have given good results.

20

The invention may be more readily understood by reference to the following illustrative, non-limiting examples. In these examples, tintability is measured as follows: A coated and cured sample is immersed in BPI Black Dye (1% Transmission, Brain Power Inc.) at 95°C-100°C for 15 minutes and then rinsed with water and dried. The transmissivity T of the sample

is measured spectrophotometrically, and tintability is reported as percentage transmissivity. Resistance to abrasion may be measured by abrading the coated surface of a transparent substrate under predetermined conditions and measuring the haze that is formed as a reduction in light transmissivity. One such testing apparatus is referred to as a Taber Abrader, a product of Byk-Gardner. Abrasion resistance testing with this equipment may be performed in accordance with 5 ASTM D 1044-78. The particular equipment employed for testing coatings referred to below involved a model 5130 Taber abrader equipped with a CS10 abrasive wheel weighted at 500 grams.

Example 1

Preparation of Epoxy Base Compositions

Epoxy base #1: A partially hydrolyzed epoxy-functional alkoxy silane is prepared by combining 236g. of γ -glycidoxypropyltrimethoxysilane, 36g of water and 0.5ml of a 1% HCl solution and mixing for 16 - 20 hours. The resulting product is stripped of volatiles under vacuum.

Epoxy base #2: A second partially hydrolyzed epoxy-functional alkoxy silane is prepared by combining 246g of epoxy cyclohexylethyltrimethoxysilane, 18g of water, 20g of ethanol and 0.2g of an acidic functional ion exchange resin (CT 275, Purolite Corp.). The mixture is stirred at room temperature for 36 - 40 hours, and then is stripped of volatiles under vacuum.

Example 2

20 Two coating compositions, labeled A and B, were prepared by blending together the following ingredients, amounts being given in grams. The viscosity of the compositions were measured and compositions were coated on polycarbonate lenses and UV cured using a medium

pressure mercury bulb, 250 watts/inch. The coated lenses were subjected to the Taber Abrasion test described above.
